Patch Wallet

A smart wallet that already exists for every Twitter account, email and phone number. No seed phrase, no app to download. Launched at ETHDenver 2023.

Product Designer · Premium Studios · 2023

The wallet's design at launch is mine, and so is the identity. I also designed Patch Pay, Donate, SocialDrop and the design system. I worked out the UX and the flows with the PM, about half each.

phil *01* ppov · NF · 2023

A new wallet starts with homework. Install an app and hide a list of words somewhere safe. Only then can anyone send you anything.

Patch starts from the other end. Every Twitter handle, email and phone number has a wallet from day one, and anyone can send tokens or NFTs to it. The owner signs in with that account only when they want to take something out.

The wallet gets there before you do.

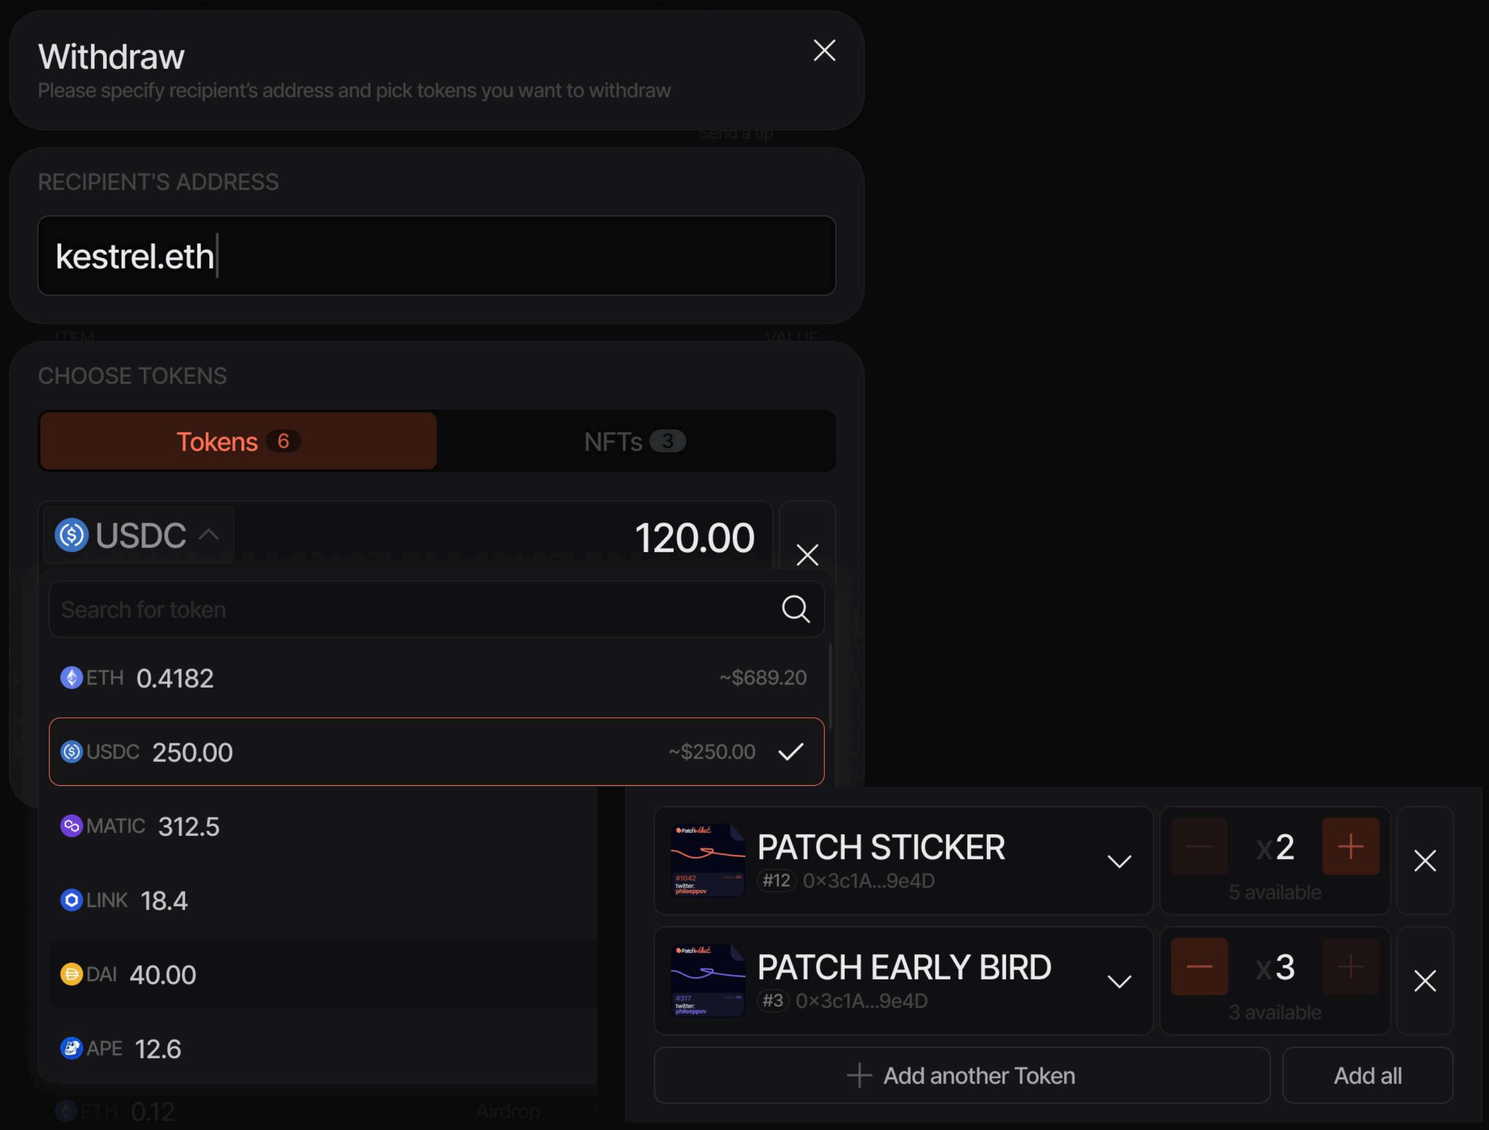

Key decisions

01. You choose what goes out

The simple withdrawal moves everything at once, or only the tokens, or only the NFTs.

I let people put the withdrawal together piece by piece. Tokens and NFTs sit on two tabs of one form, each token gets its own amount, each NFT gets a counter, and Add all is there for anyone who wants everything. Whatever you pick leaves in one transaction. The wallet page splits on the same two tabs.

A token row is a long number. An NFT row is a picture and a name cut short. They never line up, and I left the form uneven.

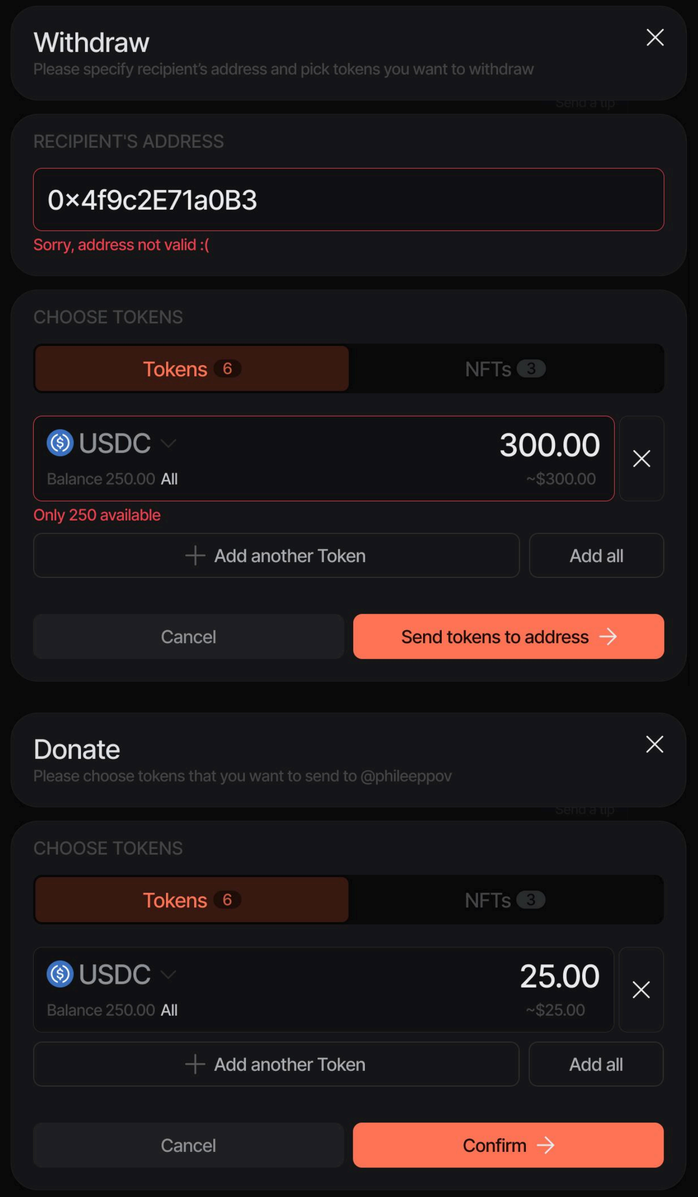

Key decisions

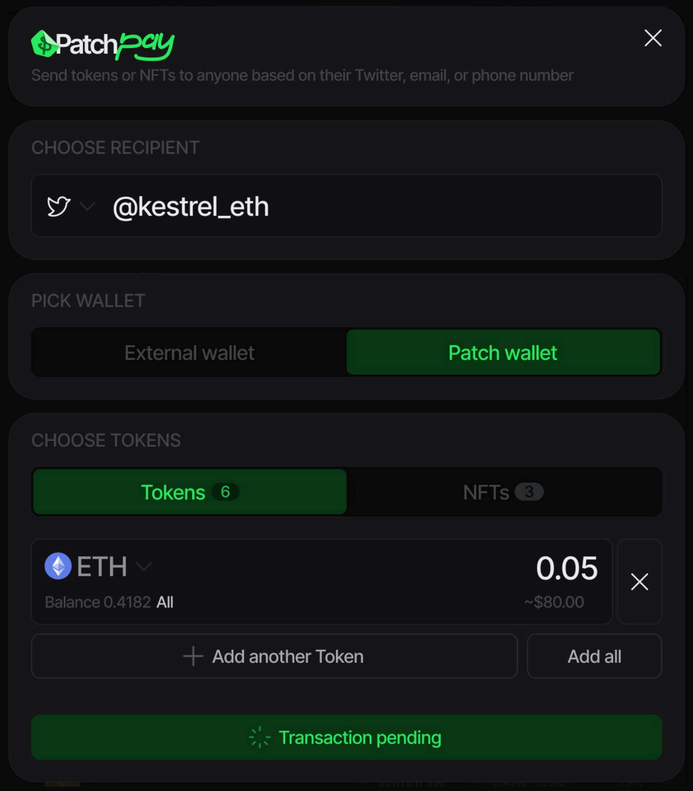

02. One picker for three flows

On deadline day I was still putting the design system together, and a lot of it didn't match. People said it was fine.

I redrew those parts so they'd fit together. Withdraw, Donate and Patch Pay now use the same token picker.

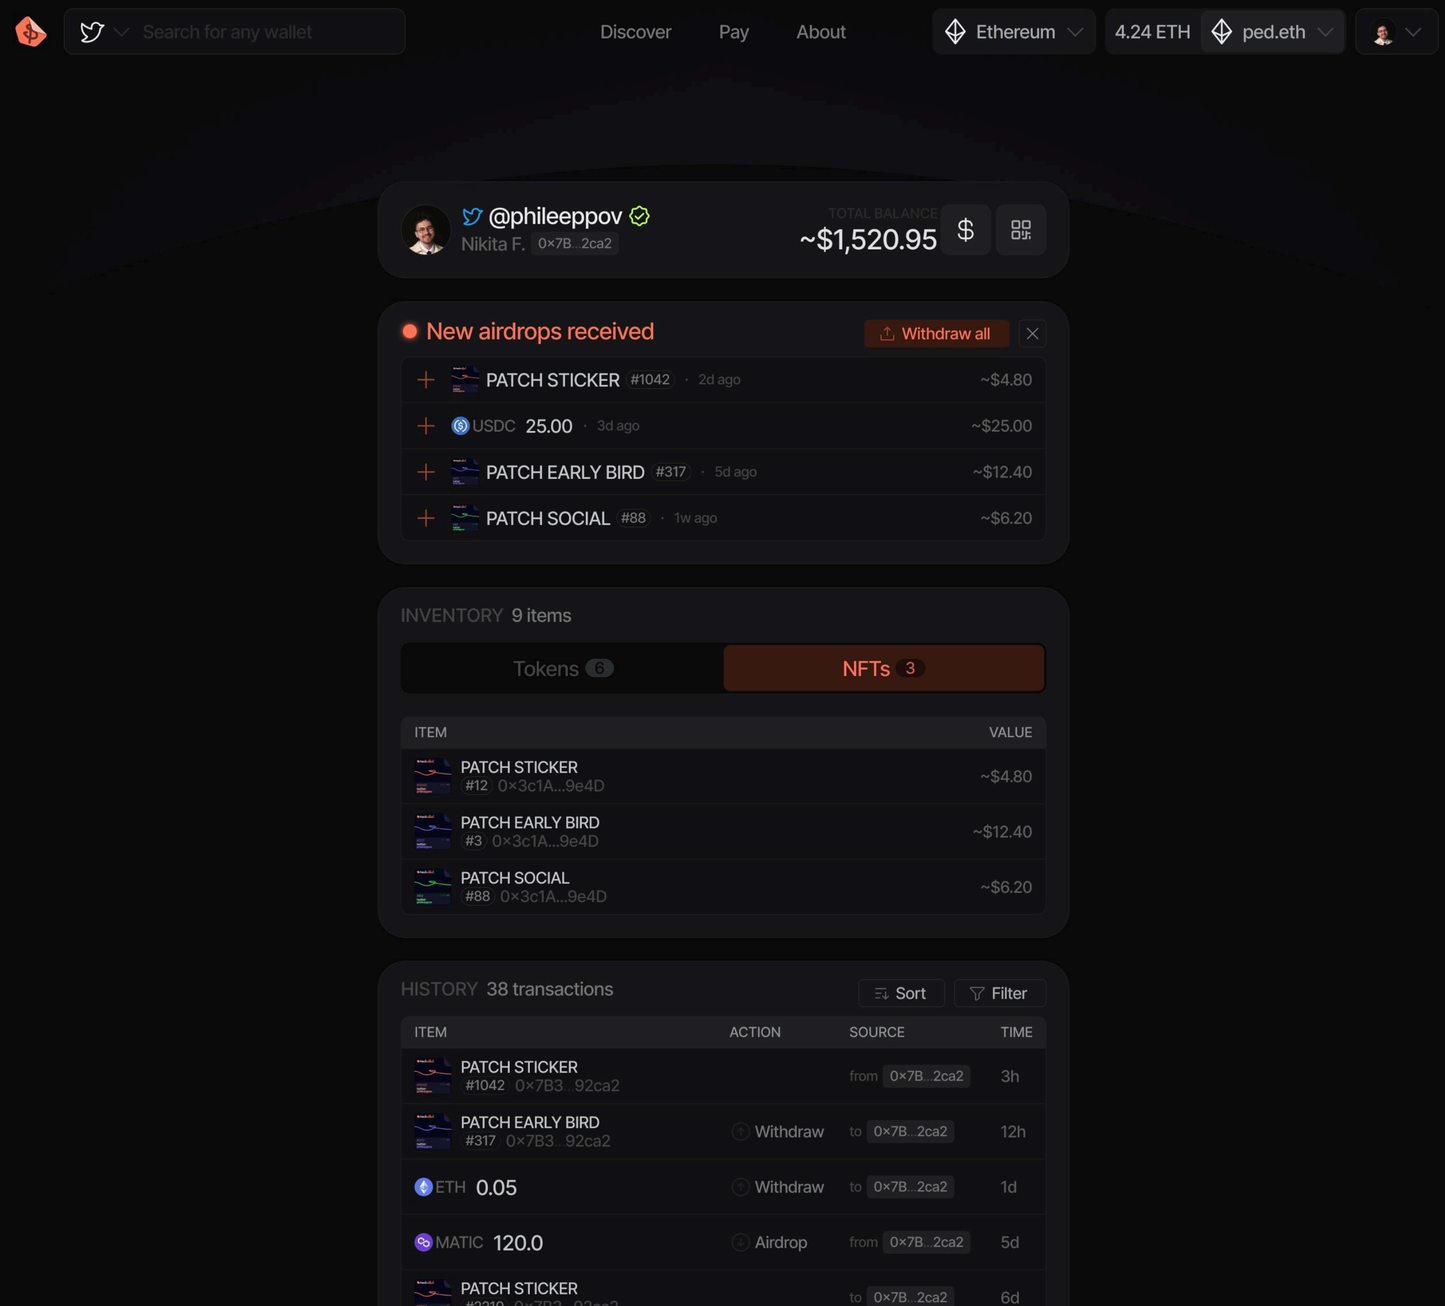

Taking Add all out of Donate would have split the picker in two, so I kept it. In a donation, one tap adds every token you hold.

What happened

The site counts over 300k users. In one campaign with Linea, 110k+ people airdropped over 150k NFTs to Twitter accounts.

Numbers from patchwallet.com, checked October 2026.

03 — Make the call, then check it

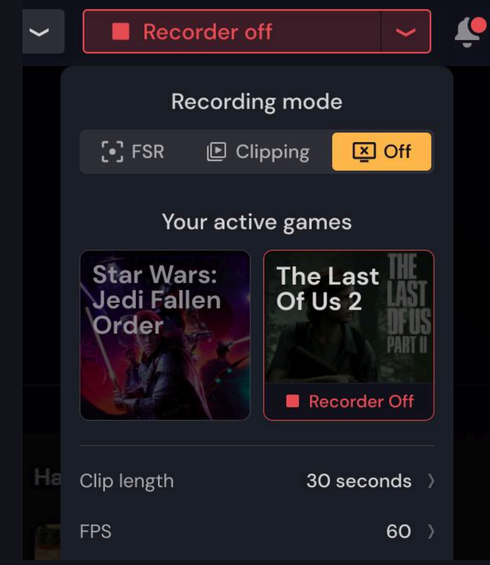

Medal.tv

How recording starts in Medal, a desktop app that records your games in the background and saves clips on a hotkey. 3 million daily users.

Product Designer · Contract, remote · Oct 2021 – Nov 2022

New users kept asking support how to start recording, and not many of them got as far as posting a clip. The PM brought me the task with a direction, and the rest was my call. I was the only designer on this flow. I handed off the design and left the company before it shipped.

Tension

Medal's top bar had one dropdown for everything. It showed your online status to friends, and once a game was running it said "Clipping: PayDay 2". Clicking it opened a stack of quality settings. Nothing about how to save a moment. Next to it sat a separate Add Game button.

My notes from back then: the Add Game button makes it unclear how to start recording. The difference between full session and clipping isn't clear. There's no control over a recording that's already running.

A round of small patches would have closed the tickets. Rename the button, label the modes, add some tooltips.

Add Game Button

↓

Not clear how to start recording

↓

Not clear the difference between FSR and clipping

↓

Lack of control of current recording

The app said it was recording. What to do next was up to you.

Key decisions

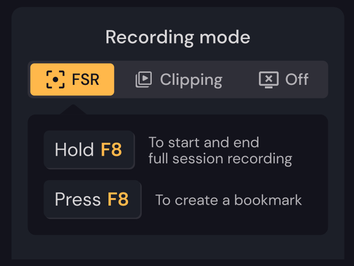

01. Recording gets its own place

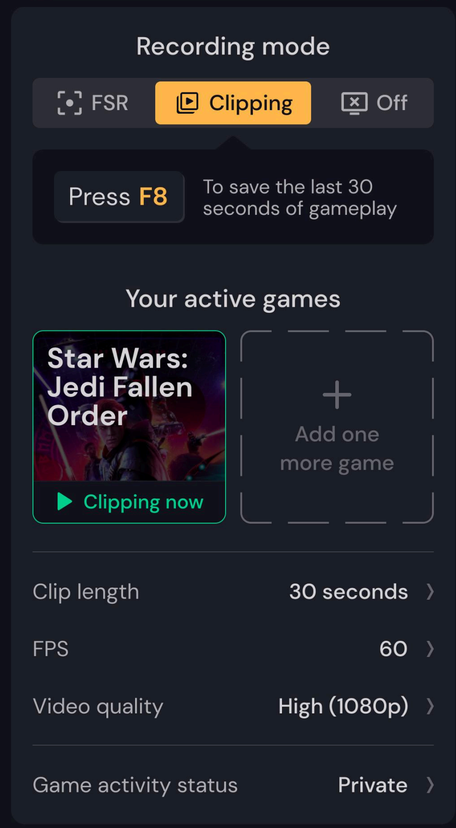

Online status and recording status lived in one dropdown.

I pulled everything about recording out of it. Online status stayed on the left, next to the avatar. Recording got its own button on the right, named after the game you're playing. Inside: the mode (clips, full session or off), your active games with their covers, and a slot to add one more. The Add Game button became that slot.

The hint under the mode changes with it. In clipping it says press F8 to save the last 30 seconds. In full session, hold F8 to start and stop.

The cost was the settings. Everything except clip length, FPS and quality moved one level deeper, and people who tuned their recording now take an extra click.

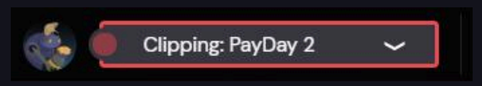

Key decisions

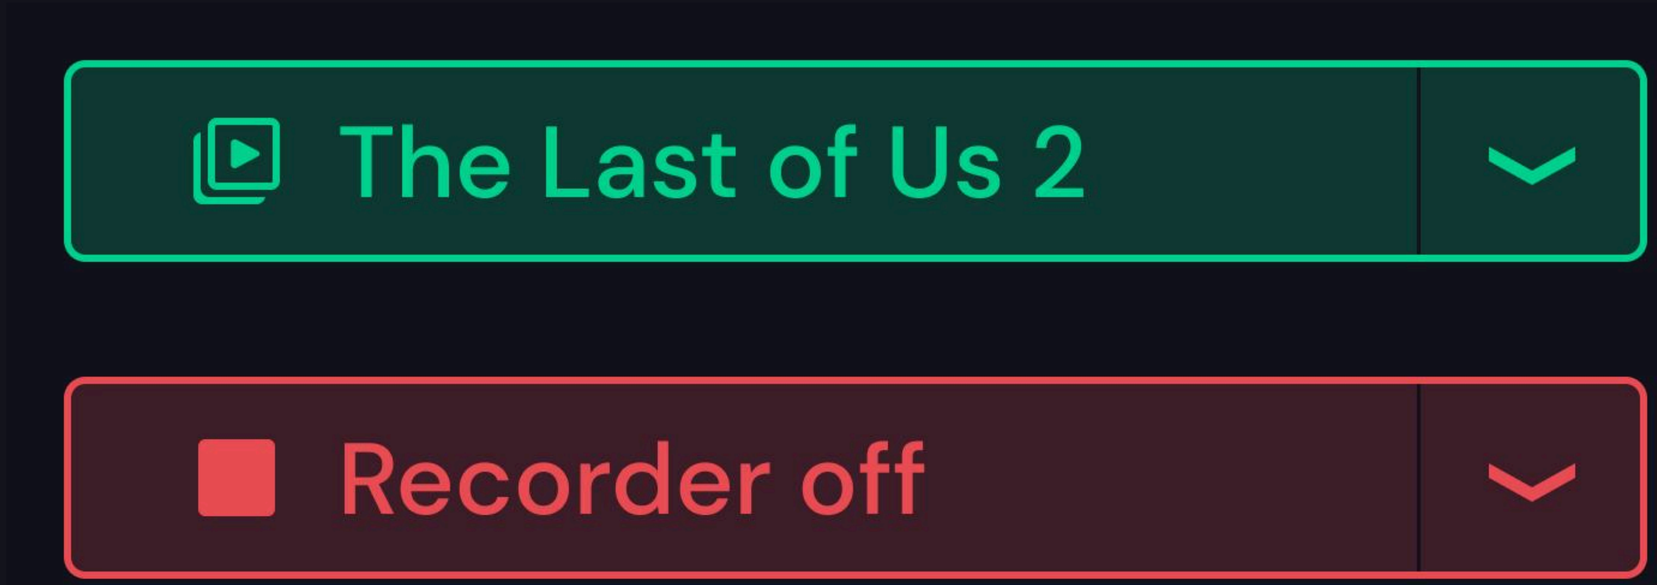

02. Recording is the normal state

Recording is red. It's red on every camera, and it was red in Medal too, a red dot next to "Clipping: PayDay 2".

I flipped it. While Medal records, the button and the game's frame are green. Red is for "Recorder off". For an app that records in the background, recording is the normal state. The thing to worry about is when it stops, because the next moment won't be saved.

It breaks a convention people know from every camera.

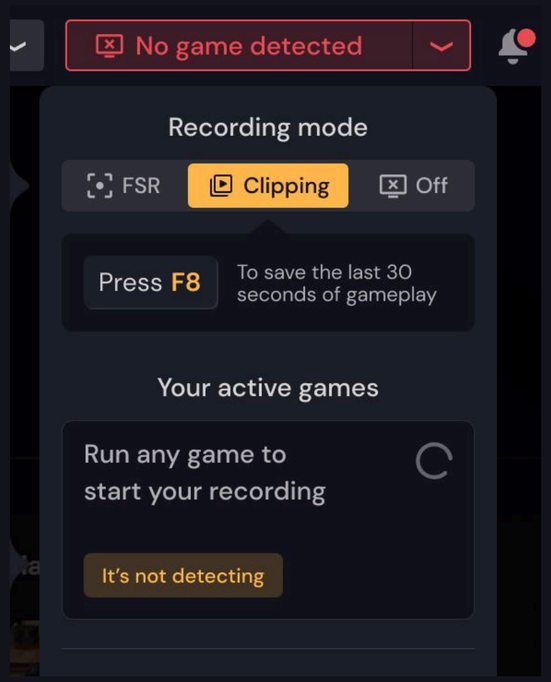

What happened

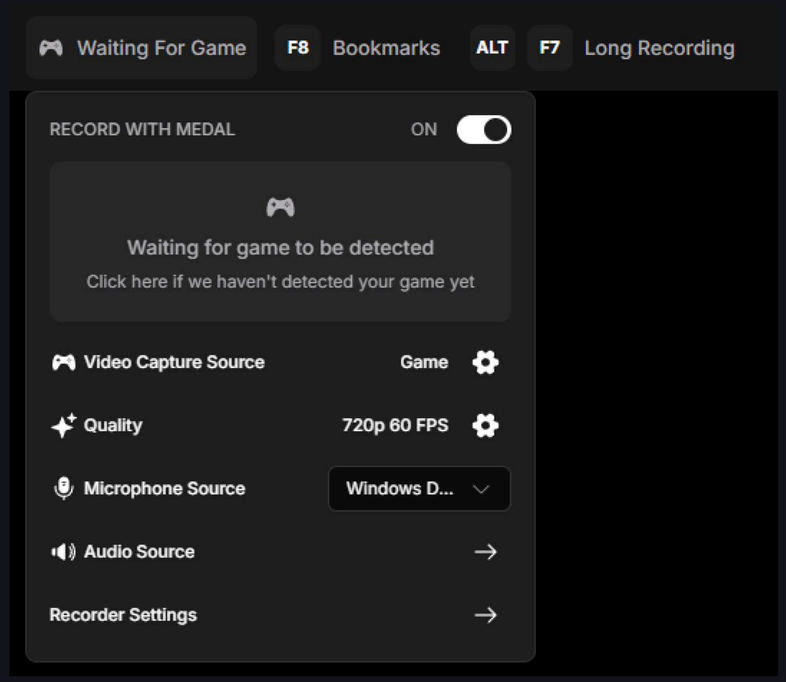

The flow shipped about six months after I left, with small changes.

Medal has been through two redesigns since. The mode switch didn't make it: off became a toggle, and full session moved to its own hotkey.

The core held. Recording still has its own button in the top bar. The game you're recording sits in a green frame next to an Add Game slot. The hotkey stays on screen, and if detection fails you can still pick the process yourself.

04 — Character is not a layer

SPORTS CLUB

A daily fantasy league for football and basketball by PlayMini. Collect cards, build a lineup, stake ETH on a day's games.

PlayMini — fantasy sports on crypto · Nov 2025 – Apr 2026
Identity and product design, 0→1.

Identity, landing page, cards and packs, the core product screens and the autobot setup. A second designer carried the system into the rest of the product without working alongside me.

phil *03* ppov · NF · 2026

Tension

Fantasy sports products are built around the players. Clean cards, collectible finishes, the world where millionaires play ball among themselves.

Nobody in that world is buying packs. The people picking lineups are somewhere else entirely, and that place is loud, dirty and in a hurry.

The fan isn't in the arena. The product shouldn't pretend otherwise.

Key decisions

01. The fan draws on the poster

Collectible cards are sold on condition. A clean photo, a perfect finish, nothing touched.

I gave every player his own graffiti, the way a fan treats a poster on the wall. The value is in the wear.

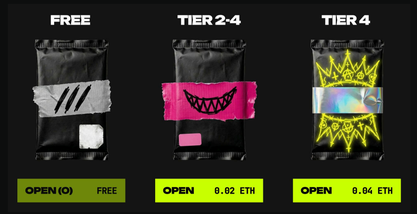

01. The fan draws on the poster

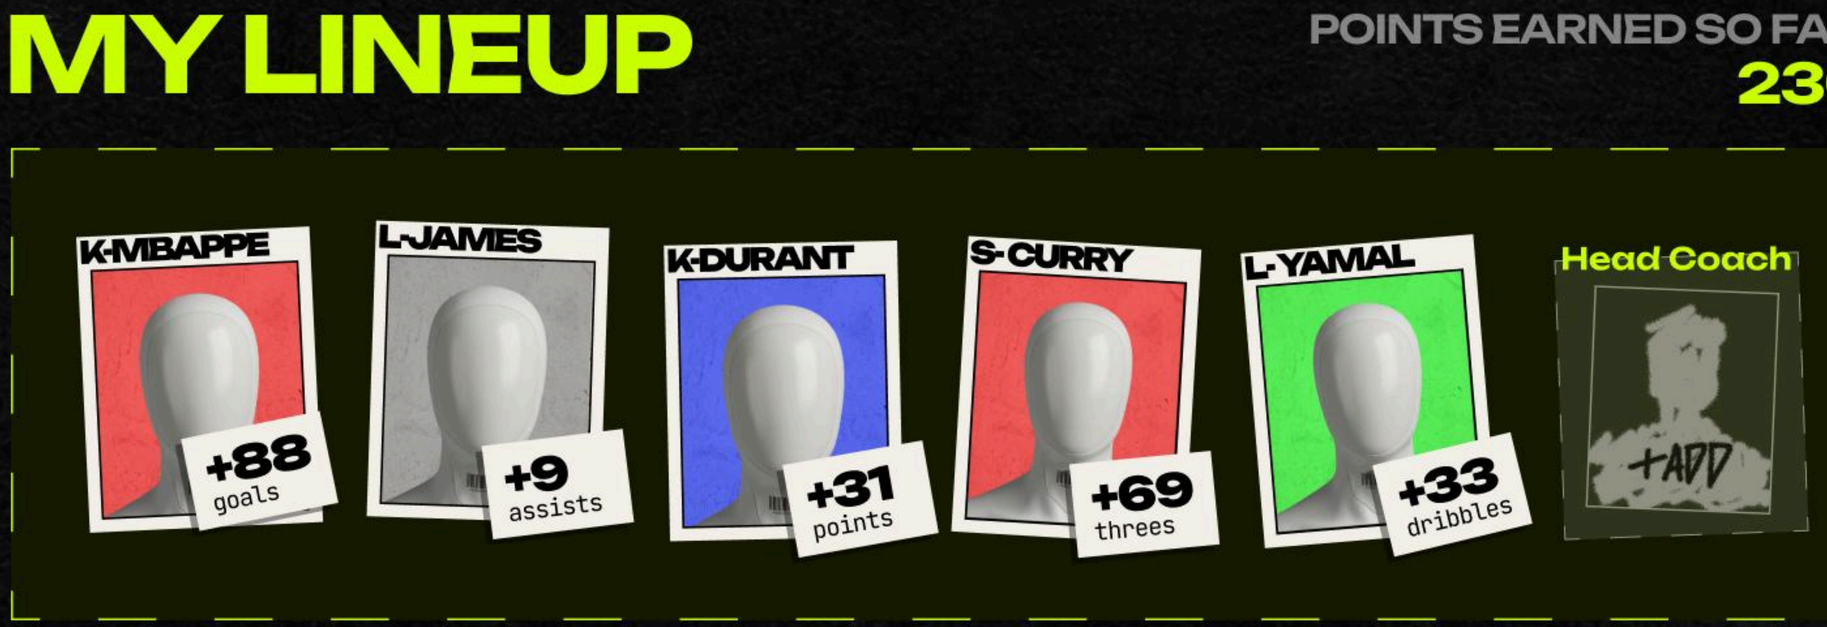

Concept

Shipped

The faces came out over image rights. The shipped cards use mannequins, rarity is carried by the background color, and the drawing survived on the packs, where rarity is what people pay for.

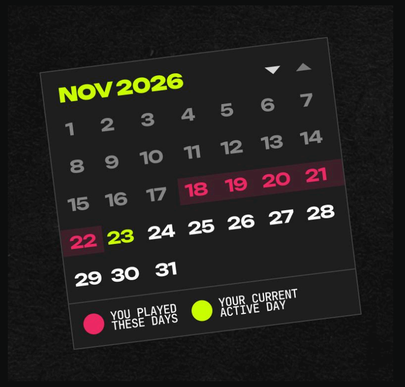

Key decisions

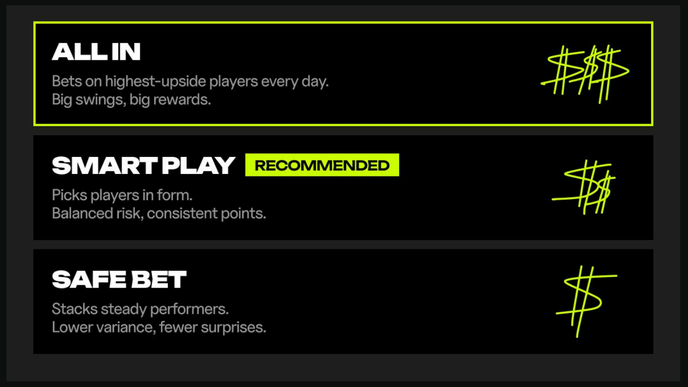

02. States are marked by hand

Products like this keep the identity on the landing page. Inside, an active state is a fill, a border or an underline, and it reads as the system talking to itself.

I sprayed over the current day. Past days get a sticker. Your stake and your place are written on paper tickets. Risk in the autobot setup is counted in hand-drawn dollar signs.

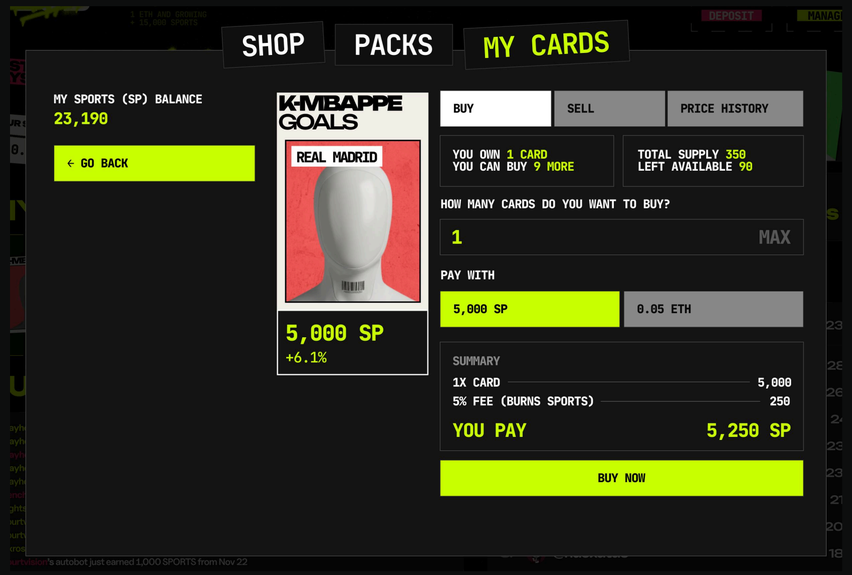

Where money moves, the noise drops. Buying a card runs on a straight grid in mono, and only the tabs stay crooked.

The first glance pays for all of this. Most of the dashboard is set in one heavy weight, and one lime carries headings, buttons and data at once. It reads slower than a dark dashboard.

What happened

It launched publicly and ran tournaments with live ETH stakes.

Ailekmed

A website for a single pharmacy: a catalog, booking for pickup and a loyalty card.

Pharmacy website · May–Jul 2026
Product design, 0→1. Six weeks, with one developer.

The pharmacy had a logo, a color and no license to sell medicines online. I carried the logo and the color into the site and designed the rest: catalog, booking, the loyalty program and its rules, and the copy. A developer built it.

phil *04* ppov · NF · 2026 · Screens localized to English for this case · © OpenStreetMap contributors

A pharmacy that just opened needs regulars before it needs sales.

Tension

Pharmacy chain websites are built for a network. Hundreds of addresses, delivery windows, a sale on every screen.

Ailekmed had just opened. One address, one shelf and a sign on the door saying so.

The obvious move was to look bigger and open on a sale.

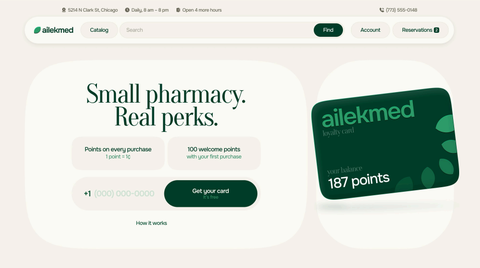

Key decisions

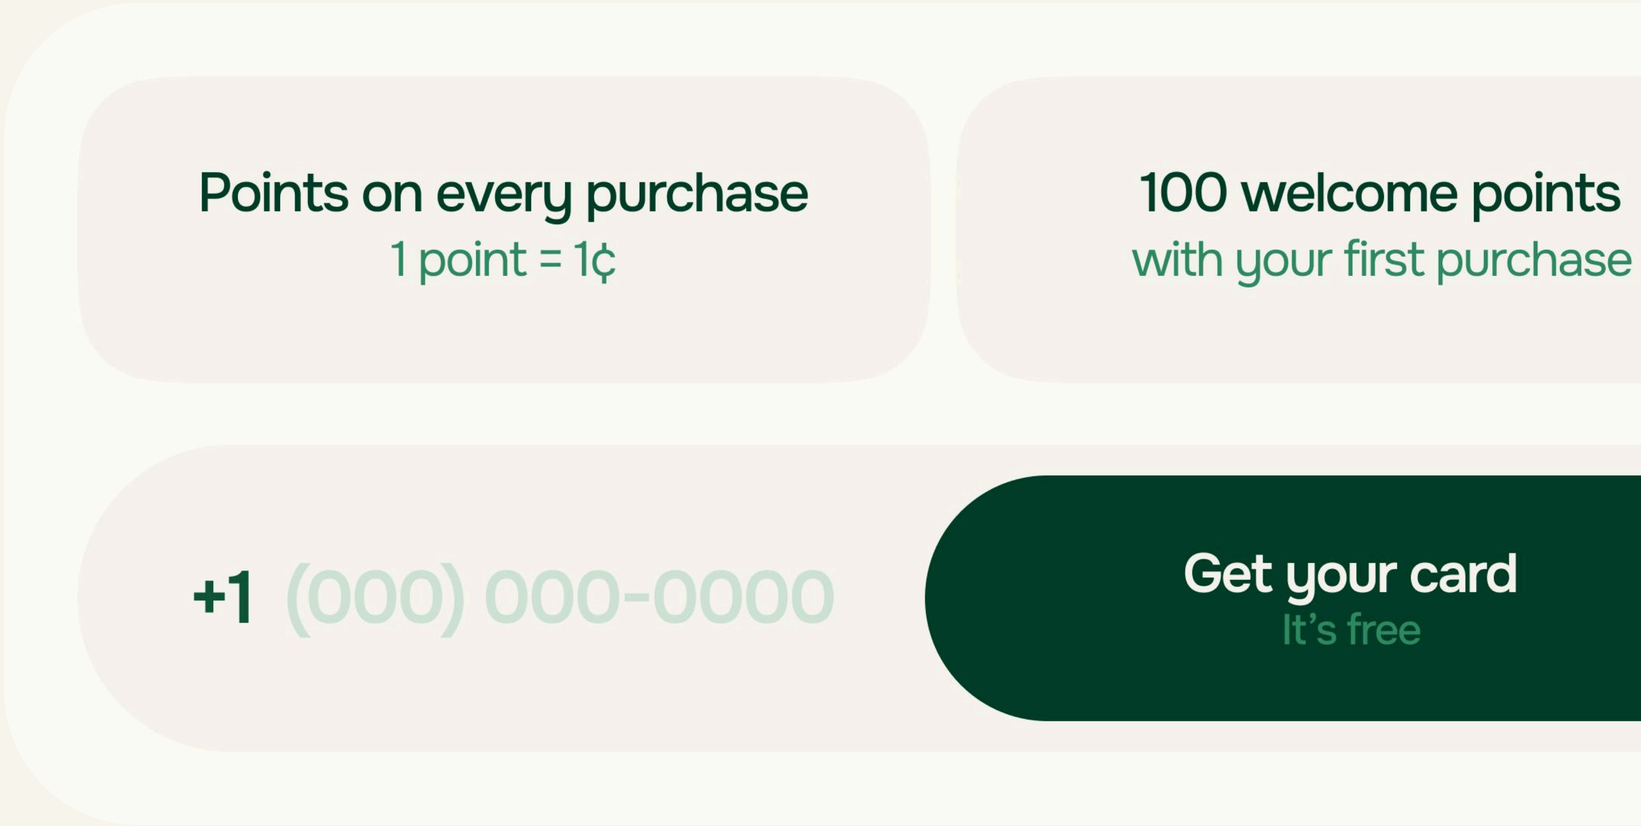

01. The card comes first

A pharmacy homepage usually opens on a promo carousel or the catalog.

I made the first screen issue a loyalty card. A phone number, one button, a hundred bonuses on the first purchase. It's a card for regular guests, and the headline promises your own pharmacy with your own savings. The card was there in the first sketch.

The first screen has no medicine on it, and people usually come for one thing their doctor wrote down. For them, search stays in the header.

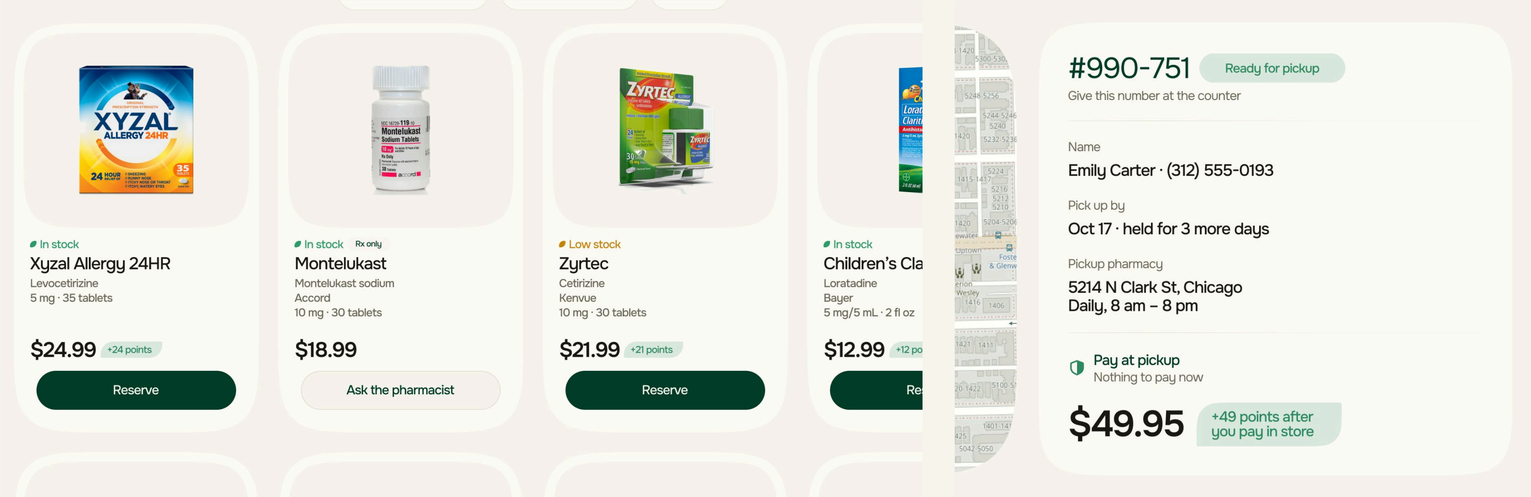

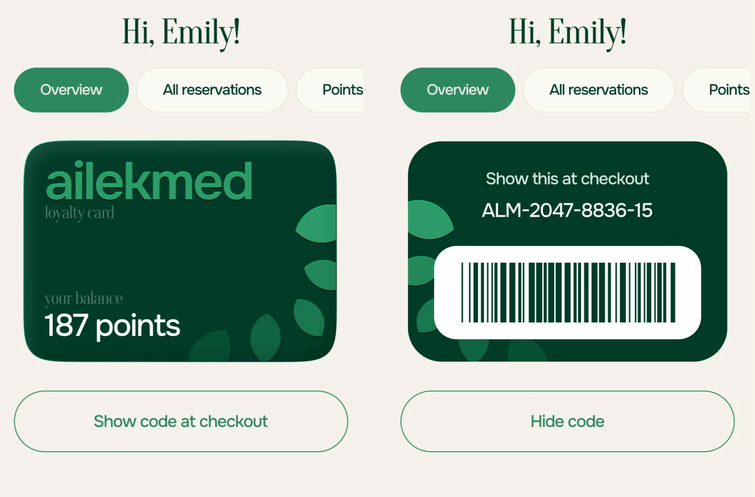

Key decisions

02. The site ends at the counter

An online pharmacy borrows its checkout from any store. Cart, order, payment, delivery.

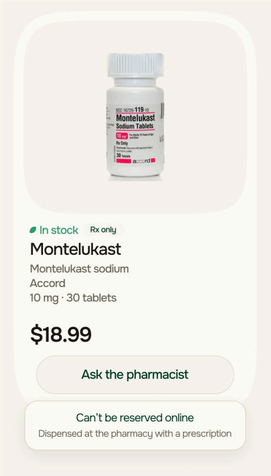

Nothing is bought here. The header says how many hours the door stays open. Every card says what is on the shelf right now, and a booking says there is nothing to pay yet. It ends with a number to say at the counter. On the phone, the loyalty card flips into a code for the cashier.

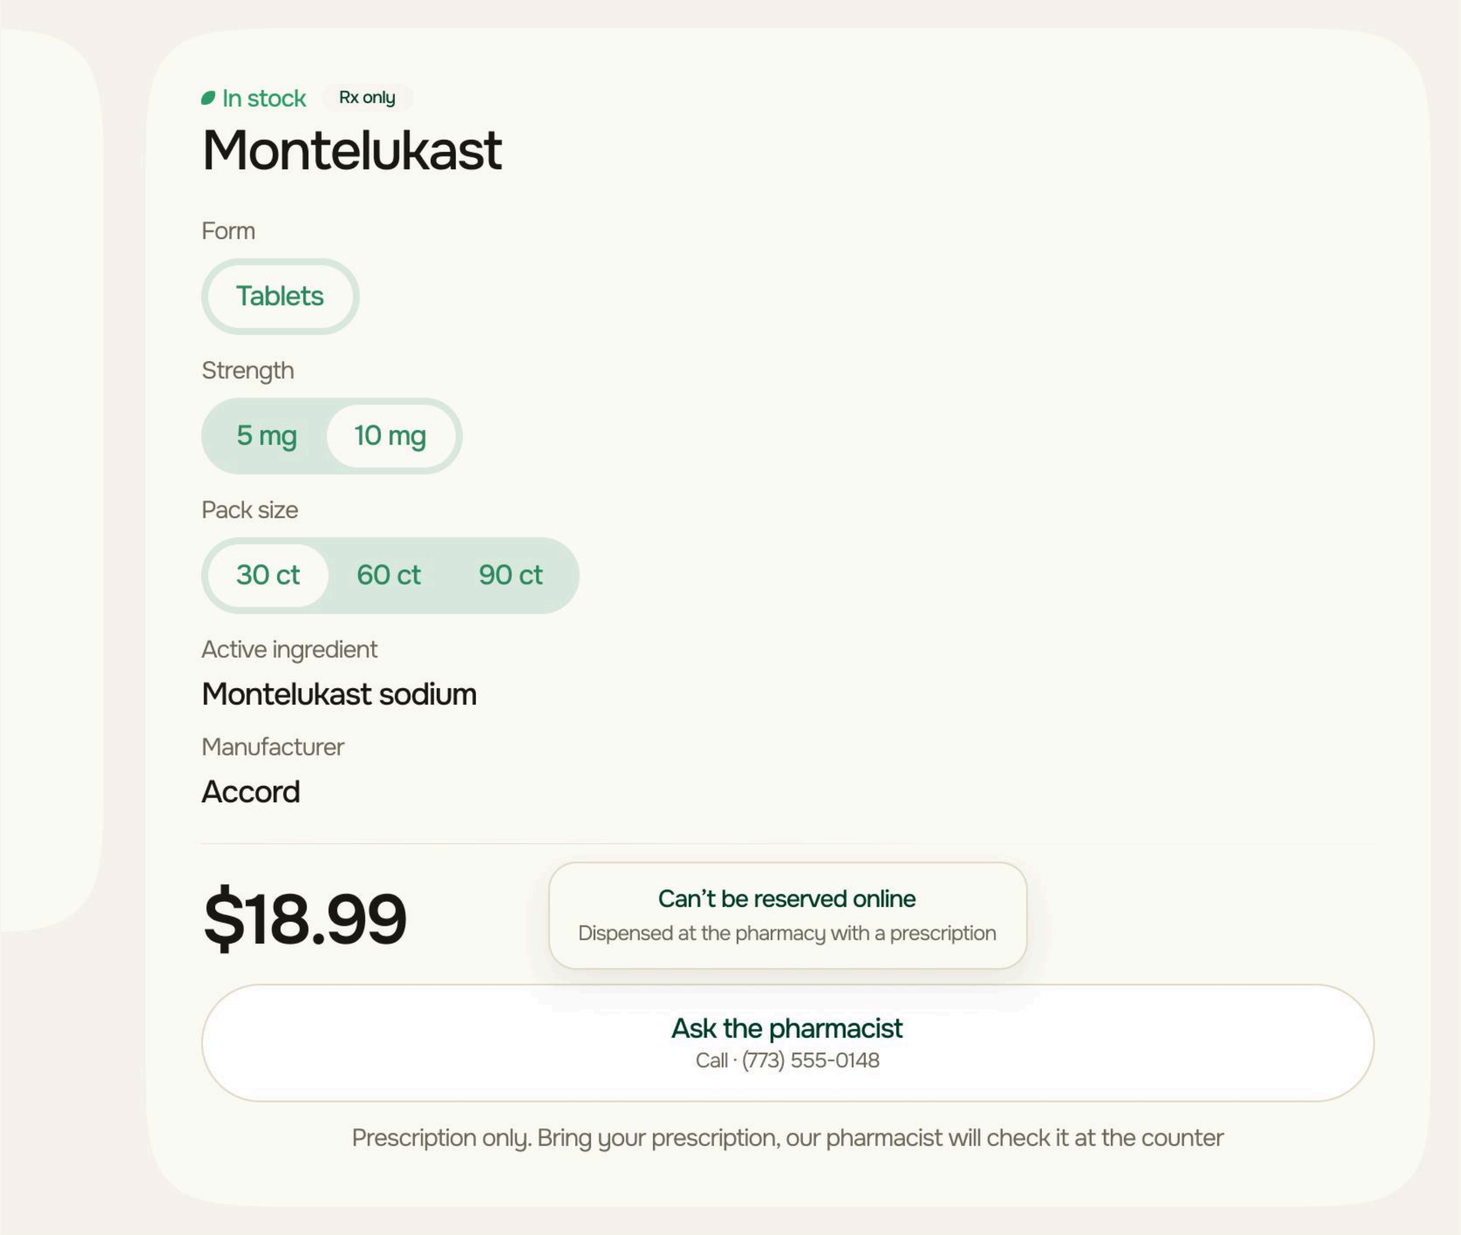

Most of the catalog is prescription only and can't be booked at all. Those medicines stay on the shelf with their price and stock, and the button calls the pharmacy.

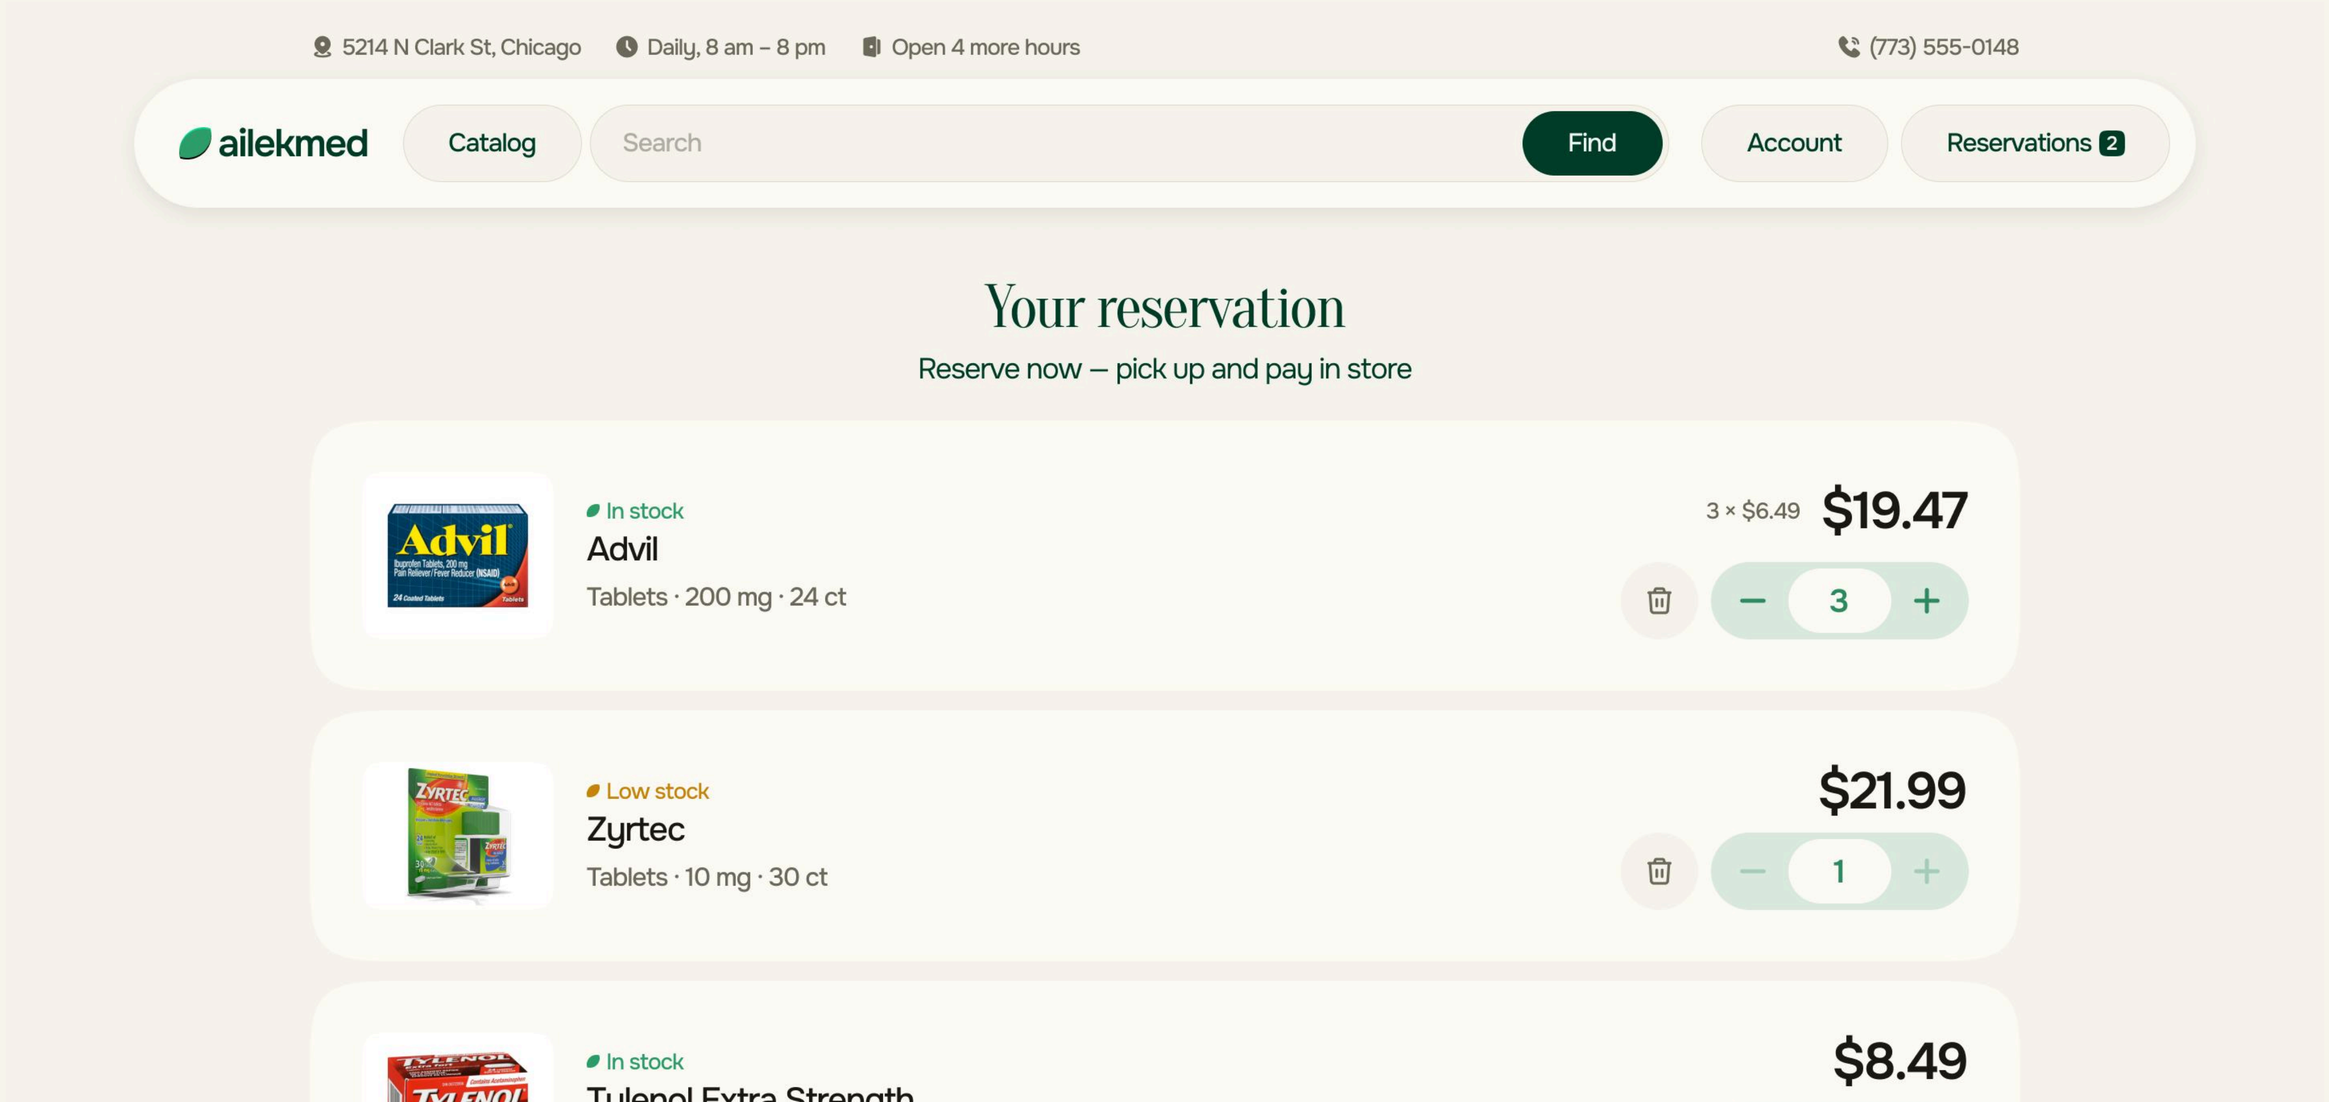

The sale never closes on the site. For most of the catalog, it can only send you in to ask.

What happened

160 people got the card in the first ten weeks. They show it at the counter.

Mavatars

Avatars, items and quests, built as a separate product to move into Medal.tv.

Avatars and rewards inside Medal · 2022

Product designer in a team with a PM, a 3D artist and engineers. I designed the feed, profile, avatar setup, inventory, store, quest board and the product's visual style, and worked out the economy with the PM. Characters and items were made by the 3D artist.

phil *05* ppov · NF · 2022

Tension

2022, and everyone was shipping avatars as NFTs. The market was already shaking, so the team kept the crypto under the hood. The player never sees a wallet.

What was left was the loot itself, and loot has a template. Rarity in five colors, rewards on a battle pass.

Every game you play should count toward something.

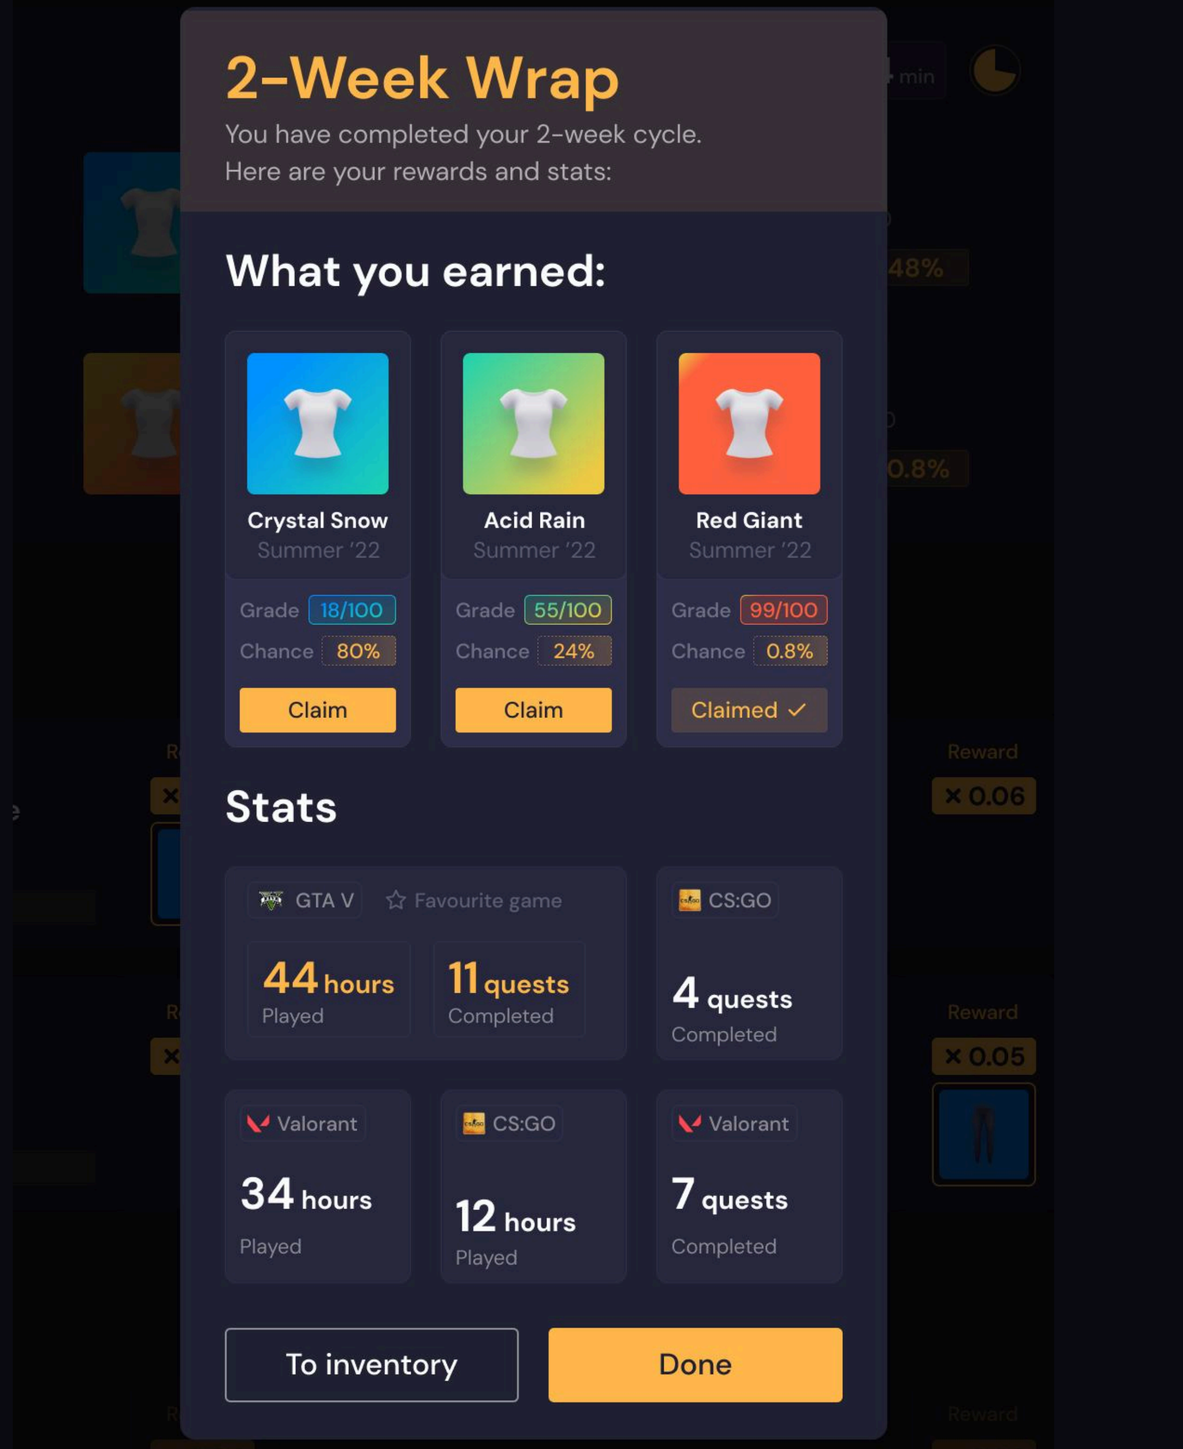

Key decisions

01. Rarity on one scale

Loot games mark rarity with a few colors. Grey, green, blue, purple, gold. Everyone knows the code.

I gave every item a grade from 0 to 100 and made its color a point on one spectrum, blue at the bottom and red at the top. A 37 and a 55 are different colors, and you can see which one sits higher.

It reads slower than the usual tiers. The first time you see it, the colors don't explain themselves.

Key decisions

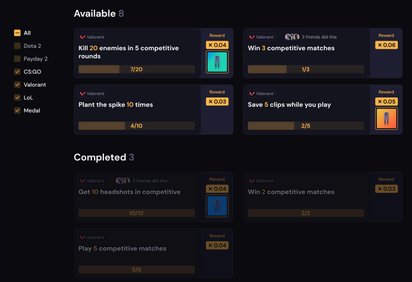

02. Quests pay in odds

The usual reward for a quest is an item. Finish the task, get the thing. Battle passes work this way.

In Mavatars a quest pays into a multiplier. Kill 20 enemies in Valorant and it grows by ×0.04. The multiplier lifts your chance at every grade. At ×1.6 a 99 drops at 0.8% instead of 0.5%. At the end of the two-week cycle you get what dropped, and a wrap of your hours and quests.

The reason was the core product. Medal only records while it's running, and quests for games played with Medal keep it running.

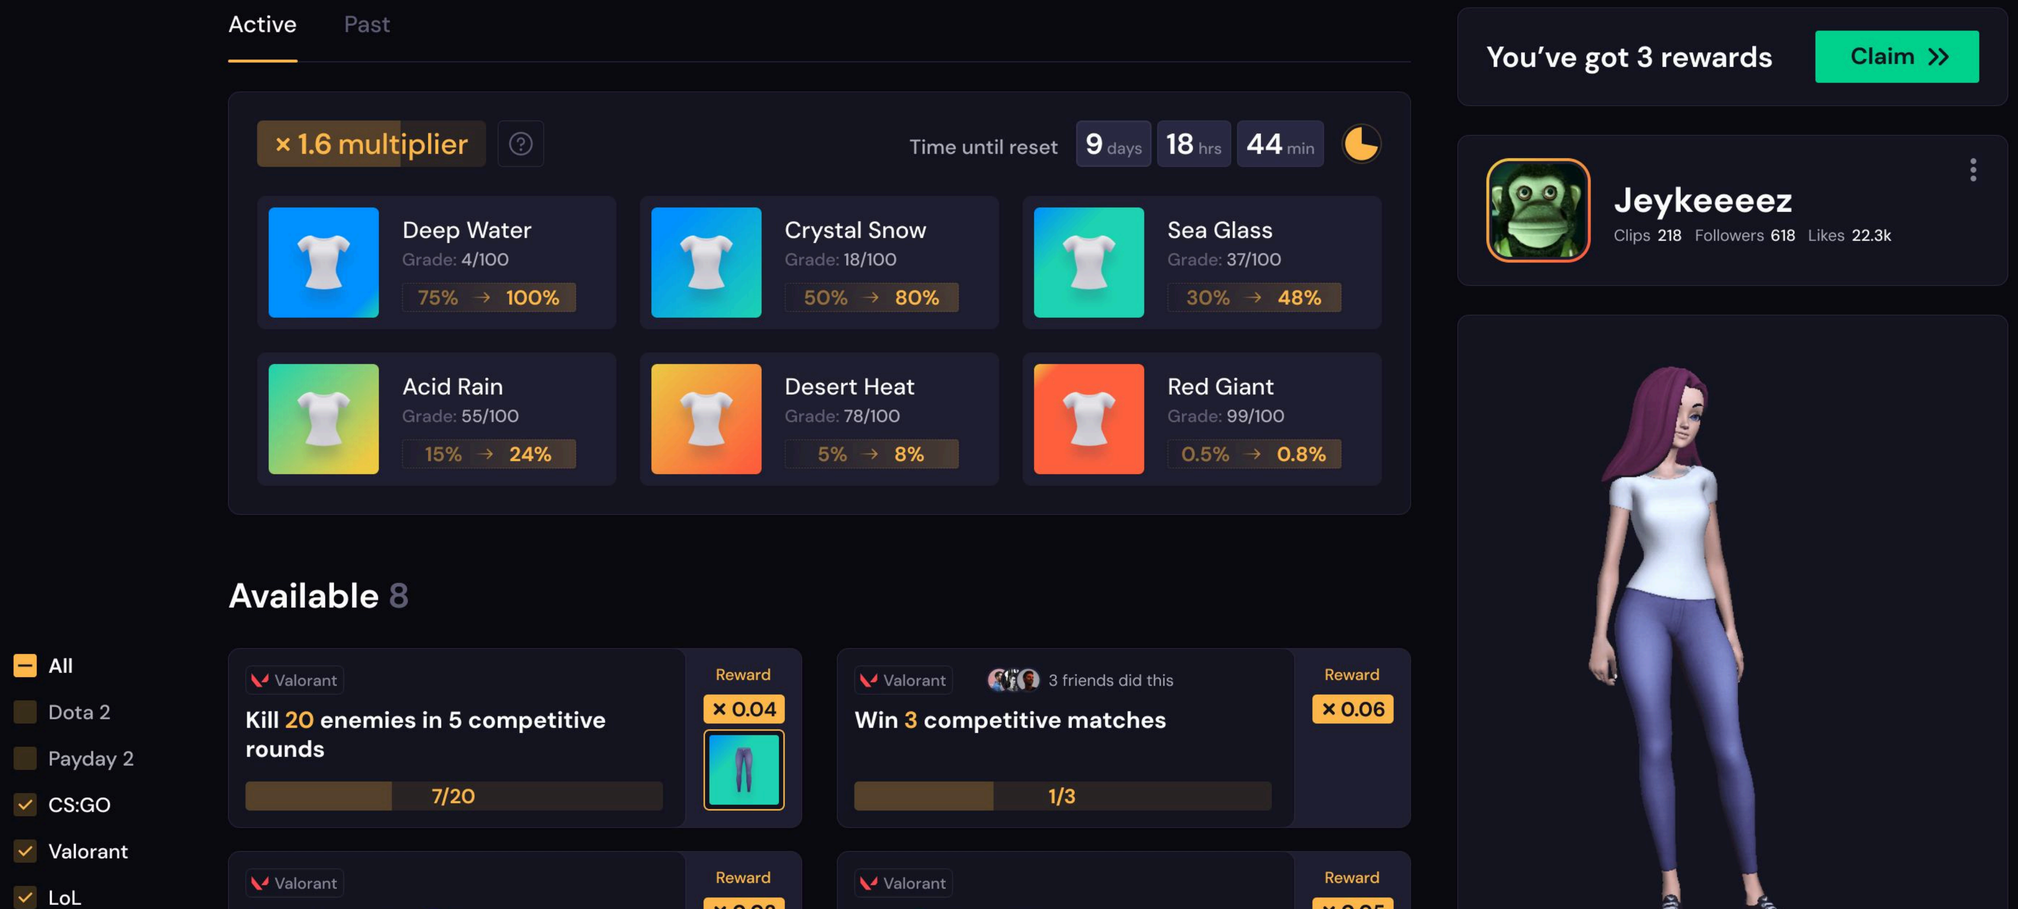

What you give up is a reward you can hold. "×0.04" means nothing at first glance, and odds sit closer to a loot box than to a prize.

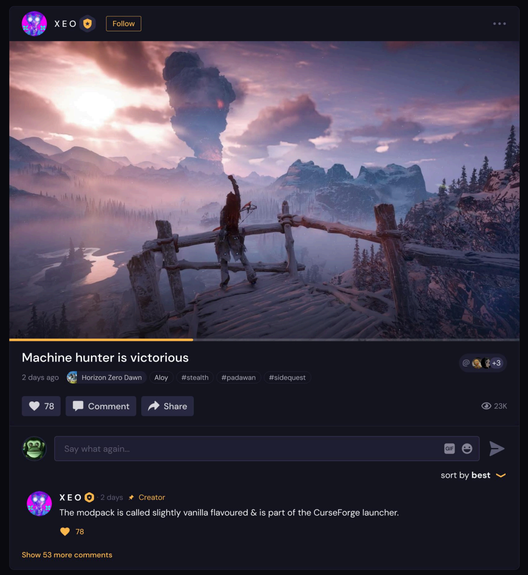

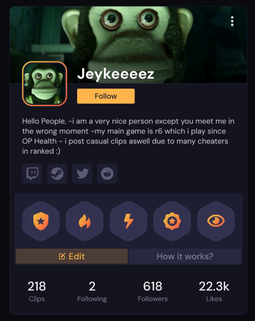

What happened

Development was running on working prototypes, and the first version was nearly done. The product didn't launch.
